Computer-aided design in CAD Traditional CAD tools used in industry and design-related fields require users to manually draw and to place entities on a work area. In contrast, Computer-aided design (CAD) is a sub-discipline of computer graphics that automates the process of designing a three-dimensional virtual representation of a subject in order to make the design more manageable and efficient. Instead of physically constructing a drawing to plan a building or a city, a CAD designer first creates the objects that represent the building's components. The designer draws a model of each component, then joins the components together. The components can be movable or fixed, connected or unconnected. A CAD system can then automatically produce a 3D rendering of the model, showing the resulting objects and their component parts, and the system can export the rendering into a file that is a digital blueprint for the real-world object. CAD software normally enables users to view the 3D model using virtual reality, usually via a headset like a virtual reality headset, such as an Oculus Rift, or a monitor attached to a VR headset like the HTC Vive or the Oculus Rift. Some CAD software, such as Autodesk's Revit, can export the model as a more traditional 3D model, with only the boundaries of the model being rendered, which can then be printed or viewed in an immersive 3D modeling program. CAD software for building design typically provides a 3D view of the building and its components.
