Field of the Invention The present invention relates to the testing of semiconductor integrated circuits and, more particularly, to a method for determining the alignment errors of an integrated circuit. 2. Brief Description of Prior Developments In the manufacture of semiconductor integrated circuits, it is important to be able to quickly and accurately determine whether and where a defect is located. Accordingly, various methods and processes for the detection of defects have been developed. One example is the use of charged particles, such as electrons and ions to inspect a semiconductor wafer. An example of an electron defect inspection system is a scanning electron microscope (SEM). In a SEM, a primary electron beam is directed at the surface of a sample, and an image is formed of the sample based on the intensity and angle of the electrons reflected from the surface. Typically, the SEM uses a raster scan of the primary electron beam across the surface of the sample to form the image. In semiconductor manufacturing, electron beams are used to image defects in semiconductor wafers. A typical SEM system includes an electron beam column, which is located adjacent to a wafer processing chamber. The electron beam column includes an electron beam column housing, a deflector for deflecting the electron beam, a pre-deflection aperture, a pre-deflection quadrant filter, a wafer stage, and 3e33713323
